Murine strain combinations have been used to study the immunological response during acute graft-versus-host disease (GVHD). To elucidate the mechanisms of GVHD, we analyzed the immunoglobulin (Ig) isotype expression of host effector cells infiltrating the liver, lung, and gut at different times after transplantation with allogeneic effector cells. Using anti-Thy 1.2-antibody and immunohistochemistry, we observed Thy 1.2+ T lymphocytes to be the predominant effector cell population in the lung at all times after transplantation. In contrast, by immunohistochemistry, Thy 1.2+ T lymphocytes were absent from the liver and gut at the time of GVHD induction and then increased in frequency, peaking at day 10 after transplantation. The development of the acute GVHD response after allogeneic transplantation was associated with a selective and coordinated increase in the percentage of IgM+ and IgG1+ cells. However, the increase in IgG2a+ cells was delayed, with IgG2a+ cells seen only in the liver on days 7 and 10, when the number of IgM+ and IgG1+ cells was maximal. In contrast, the population of IgM+ cells was not significantly changed. These data demonstrate that the acute GVHD response is associated with a preferential expansion of effector cells with a particular pattern of immunoglobulin isotype expression.A conventional antenna using a ferrite core is known as one type of the antenna which is used in a cellular phone. In the conventional antenna of this kind, a magnetic flux density passing through the core is concentrated in a circular polarization, and therefore an antenna gain is little in the vertical direction and the horizontal direction, and a gain in a direction orthogonal to the vertical direction

Here is what KEYMACRO is about. It is a system for quickly copying various key sequences to the keyboard. In other words, it allows you to set up a sequence of key presses on a keyboard in order to make the computer respond in a certain way. In addition, it lets you specify the exact position on the keyboard where you want to press certain keys. In short, it basically lets you map various sequences on the keyboard. In the same way, it can work with various applications. For example, the key presses may apply to a certain text entry field. In fact, it can be set up to respond to specific keyboards, so that it works with different computer configurations. There is also a simple game mode available in case you want to simply practice copying key sequences. KEYMACRO allows you to do the following: - Copy a key sequence to a keyboard - Specify the position on the keyboard where you want to press - Specify the exact key sequence - Export key mappings in the form of text files - Load key mappings - Delete key mappings - Convert key mappings - Change key mappings - Add a new key mappings - Delete a key mappings - Add a key mapping for all
