I have a wallet in Parity and recently, without doing anything, it started asking me to save my wallet. This is odd, because I don't even have any BTC or ETH on the wallet. Why would it be asking me to save my wallet, and why is it in a non-standard location? Also, since I'm paranoid, is there anything to worry about if I don't save my wallet? This is just the most recent asking, it's been around for weeks and months before. A: Save your wallet is not an attack, it is a known feature of Parity. Parity wallets by default are stored in plaintext. When you sign up for an account at a service, your wallet's private key is converted to a p2sh address for use in Ethereum transactions. As explained on Parity's website: Parity will create a new wallet if one doesn't already exist. This happens when Parity is started for the first time after installation, and for some other reasons, for example when the Ethereum network is first started. The private key of this new wallet is used to create a new p2sh address to send funds to. ... If you want to manually change the location, you can copy your keys to the new address and then import the wallet. (emphasis added) When you visit the link above, you will be able to change the location where your Parity wallets are stored. Macrophage activation syndrome in a patient with granulomatosis with polyangiitis complicated with severe staphylococcal pneumonia: a case report. Macrophage activation syndrome (MAS) is a rare complication in patients with systemic inflammatory diseases. We herein report a patient with granulomatosis with polyangiitis (GPA) complicated with MAS who was successfully treated with intravenous methylprednisolone. A 61-year-old woman was admitted to our hospital because of chronic kidney disease and severe leukopenia and had suffered from GPA for 2 years. Her condition gradually worsened; hence, pulse therapy with methylprednisolone was started. On the third day of administration, the patient was admitted to our intensive care 4bc0debe42
